

# Eutectic alloys fusible links for medium loads

Material	Max load	Hole distances	Thickness	Types
Brass			0.8mm	5EE, 5EJ, 5EN, 5EA
				
				
	5EE	5EN	5EJ	5EA

These fusible links have a **medium response time**, between 3 minutes and 3 minutes 10 seconds, for a temperature rise rate of 20°C/min from 25°C and their thickness of metal gives them sufficient strength for their **use in multiplied mechanisms** supporting a maximum load of 300DaN.

The holes have a lip to improve their resistance to mechanical break at 25°C by avoiding the tearing of the metal.

**Material:** Brass

**Surface Protection:** No special surface protection.

**ROHS compliance:** These fusible links are available in two versions.

- Non-ROHS compliant, using traditional alloys containing lead and cadmium, for temperatures 68°C (155°F); 72°C (162°F); 96°C (205°F); 103°C (218°F); 120°C (248°F).

- ROHS compliant, using ternary alloys based on bismuth, tin and indium, (the high cost of indium makes these models 2 to 3 times more expensive than non-RoHS types) for temperatures 60°C (140°F); 72°C (162°F); 79°C (174°F); 109°C (228°F); 117°C (242°F).

**Identification:** Model, temperature in °C and date of manufacture are stamped on each fusible link.

**Tests:**

- Mechanical resistance at ambient temperature: 100% in production.
- Trip temperature under static load: by statistical sampling.
- Trip time in temperature rise under load according to ISO 10294-4: by statistical sampling.
- Holding load 1h at 60°C or 90°C: compliant and verified by statistical sampling in production (Test according to ISO 10294-4).
- Triggering under minimum load: compliant and verified by statistical sampling in production (Test according to UL33)

**Salt spray resistance:** According to ISO9227-2012, subjected to a mist formed of 20% by weight of sodium chloride in distilled water, at 35°C for 5 days (120h), the fusible links retain their aptitude for the function, in the response times specified by the standard.

Type	5EE	5EN	5EJ	5EA
<b>Welding surface (mm²)</b>	200	545	544	640
<b>Maximum permissible permanent load * (DaN)</b>	20	54	54	64
<b>Minimum triggering load</b>	4N	4N	4N	4N
<b>Mechanical breaking load at 25°C</b>	125 DaN	187 DaN	125 DaN	95 DaN
<b>Response time according to ISO 10294-4 under maximum load **</b>	3 min. 2 sec.	3 min. 17 sec.	3 min. 18 sec.	3 min. 10 sec.

\* Maximum permanent load depends on alloy composition and ambient temperature on 72°C fusible links. Values are given for guidance only, and for a 72°C non ROHS eutectic alloy. Alloys with temperatures below 72°C and those that are ROHS compliant, generally have a high proportion of Indium, which greatly reduces the mechanical strength.

\*\* Values measured in our own testing equipment. Testing conditions and equipment comply with ISO10294-4 and ISO DIS 21925-1 2017, fig. C1
